### 3. GENERAL DESCRIPTION

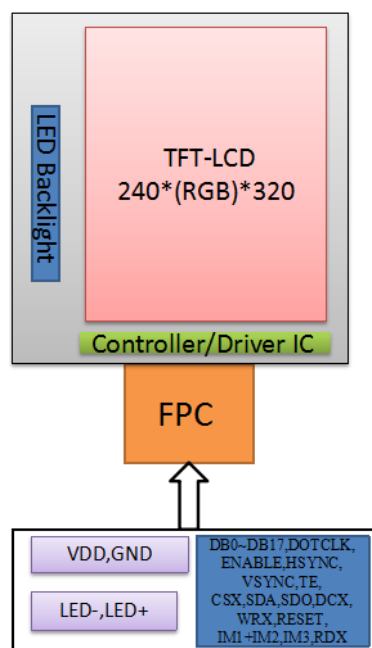

EA TFT024-23ATNN is a color active matrix LCD module incorporating amorphous silicon TFT (Thin Film Transistor). The module display area contains 240 (RGB) × 320 pixels. This product accords with RoHS environmental criterion.

Display is transfective type which means that it can be used without backlight. Compared to other TFT display technologies a bright ambient backlight (especially outside, sunlight) makes the display brighter and helps to improve contrast for reading.

**7.2 RESET TIMING**

VDDI=1.65 to 3.3V, VDD=2.4 to 3.3V, AGND=DGND=0V, Ta=25°C

Related Pins	Symbol	Parameter	MIN	MAX	Unit
RESX	TRW	Reset pulse duration	10	-	us
	TRT	Reset cancel	-	5 (Note 1, 5)	ms
				120 (Note 1, 6, 7)	ms

**Notes:**

1. The reset cancel includes also required time for loading ID bytes, VCOM setting and other settings from NVM (or similar device) to registers. This loading is done every time when there is HW reset cancel time (tRT) within 5ms after a rising edge of RESX.
2. Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below:

RESX Pulse	Action
Shorter than 5us	Reset Rejected
Longer than 9us	Reset
Between 5us and 9us	Reset starts

3. During the Resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out-mode. The display remains the blank state in Sleep In -mode.) and then return to Default condition for Hardware.

Reset.

4. Spike Rejection also applies during a valid reset pulse as shown below:

5. When Reset applied during Sleep In Mode.
6. When Reset applied during Sleep Out Mode.
7. It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

**8. OPTICAL CHARACTERISTICS**

Optical characteristics are determined after the unit has been 'ON' and stable for approximately 30 minutes in a dark environment at 25 °C. The values specified are at an approximate distance 500mm from the LCD surface at a viewing angle of  $\Phi$  and  $\theta$  equal to 0°.

Note:

1. The test samples have recovery time for 2 hours at room temperature before the function check. In the standard conditions, there is no display function NG issue occurred.
2. All the cosmetic specifications are judged before the reliability stress.

**10. QUALITY**

**10.1 INSPECTION METHOD**

An appearance inspection should be conducted at 30 cm or more distance/height from the inspector's eye sight to the LCD module surface under fluorescent light. The distance between LCD and fluorescent lamps should be 100 cm or more. Viewing angle for inspection is 45° from vertical against LCD.

**10.2. QUALITY LEVEL**

The AQL for major and minor defects is defined as follows:

Partition	Definition	AQL
Major defect	Functional defective in product.	0.65
Minor defect	Meet all functions of product but have some cosmetic defective	1.0

**10.3 DEFINITION**

**10.3.1 The environmental condition of inspection**

- 1) Ambient temperature : 22°C±5°C, 65±20%RH
- 2) Function inspection : less than 200-300Lux
- 3) Visual inspection : 750±150Lux
- 4) Total inspection time:in 15s

**10.3.2 Definition of dot defect**

The size of a defective dot full of a whole dot, and all bright dot or dark dot defect must be visible through ND 5% filter.

**Bright dot**

Dots (Sub-pixel > 1/2dot) appear bright and unchanged in size when TFT is displaying.

single dot

two adjacent dots

three adjacent dots

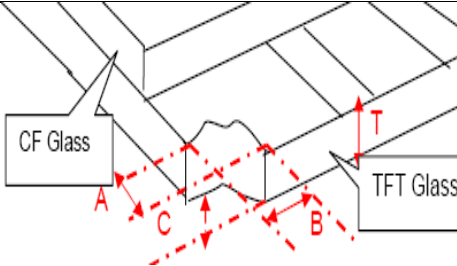

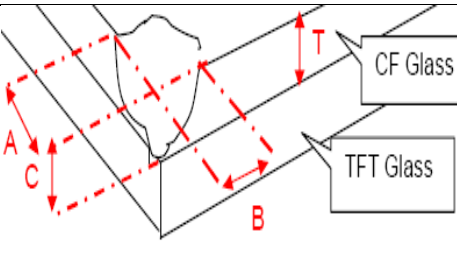

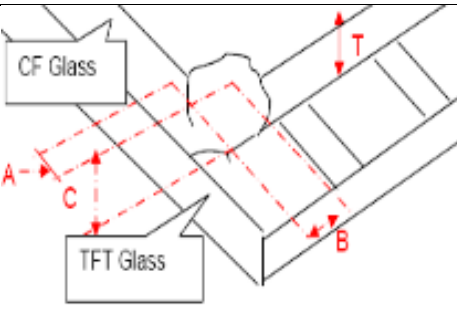

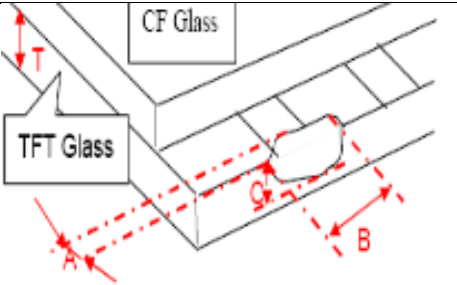

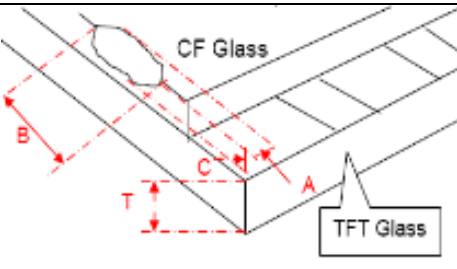

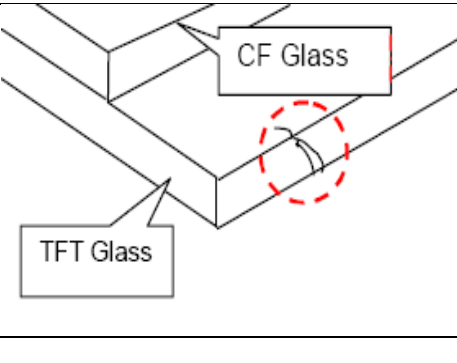

**Dark dot**

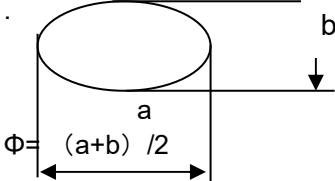

The same definition of bright dot, but always display dark

**The usage of ND 5%**

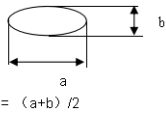

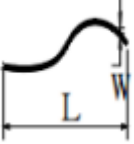

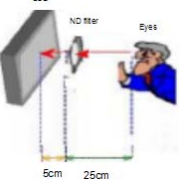

Use the ND 5% to cover bright dot within 2s, it should be judged OK if it's invisible.
