

Tutorial Panels Uno **Volta**

UV-105

Tutorial Panel of Connecting the Home Interface, Internal Unit

The UV-105 tutorial panel is designed to get you acquainted with the issue of a classic home interface. The panel includes an internal micro-telephone with speaker and microphone, and a button to control the electric home lock. This panel does not have a power supply, it is powered from the UV-104 panel. For better demonstration, we recommend using two UV-105 panels with one UV-104 panel. Students can then practically verify the connection and function of the home micro-telephone when communicating with an external unit and remote opening of the front door.

Parts used:

Internal microphone; includes an earphone
and a base unit with a push-button

Examples of connection

- Connecting the home interface to the controller which enables you to control it from one place
- Connecting the home interface to the controller which enables you to control it from two places
- All connections must be realized with the connection in conjunction with the UV-104 panel

Accessories:

- Power cord
- Operating Instructions

Optional accessories

- Security patch cords
- Protective bag
- Task book
