The shaftless design allows for employment of different engagement mechanisms, such as a customized shaft, a motor control or a human interface adjustment. This potentiometer can also control variable outputs including frequency, change in motor speed or volume.

#### STEPPED OUTPUTS / CONSTANT VALUE ZONES

Contact Piher Sensing Systems for ordering information.

#### **IMPROVED REPEATABILITY**

Constant value zones can be combined with strategically located mechanical detents to provide exact alignment between the electrical output (flat areas) and the mechanical detent position.
This provides clear mechanical positions that are not only repeatable, but perfectly aligned electrical outputs at each of the (detent) angles. The detents also prevent output values from changing due to vibration or accidental rotor movements.

The result is a higher level of precision in controlling lighting, temperature, motor or other electronic control systems.

Standard mechanical life is 500 cycles.
Long life versions are available upon request and have the following characteristics at Ta: Potentiometers with 1 to 3 detents up to 10K cycles; Potentiometers with 4 and more detents up to 5K cycles
Please consult Piher Sensing Systems if unique non-overlapping values at each detent position or LOG/ALOG tapers are required.
Different output voltage values can be matched at each detent position (see next section).
Detent torque can vary from 1.2 to 2.5 times the standard potentiometer torque.
For more than 16 detents versions please contact Piher Sensing Systems.
