

Issue 11.2018

**EA PLUG-Series** 

# **TECHNICAL DATA**

- WITH CAPACITIVE TOUCH PANEL
- 4 SERIAL INTERFACES USB, RS232, SPI, I<sup>2</sup>C
- 8 DIGITAL, FREELY DEFINABLE I/Os BUILT-IN
- 2 ANALOG INPUTS/ 1 ANALOG OUTPUT
- 8 BUILT-IN FONTS
- POSITIONING ACCURATE TO THE PIXEL WITH ALL FUNCTIONS
- SCREENSAVER MODES
- UP TO 256 PICTURES INTERNAL STORED
- UP TO 256 MACROS PROGRAMMABLE
- MIX TEXT AND GRAPHIC, FLASHING ATTRIBUTE: ON/OFF/INVERT
- CHANGE DISPLAY BRIGHTNESS BY SOFTWARE

# **ORDERING CODES**

GENERAL

#### HARDWARE

The EA PLUG-Series consists of a OLED display, which is dimmable using software commands. The most easy way to bring it into operation is via USB. The module is designed to work with 3.3~5V VDD. Furthermore serial data transfer is possible through RS232, SPI and PC. For simple control tasks, the module has 8 freely usable I/Os, 2 analog inputs, one PWM and one analog output.

\* Connectors are only included in hardware version Z (e.g. EA PLUGL128G-6TCZ)

## **PIN ASSIGNMENT ZIF CONNECTOR (J3)**

| Pin | Symbol           | I/O    | Description  |  |
|-----|------------------|--------|--|--|
| 1   | GND              |        | Ground 0V  |  |
| 2   | Vin              |        | Power Supply 3.3~5V  |  |
| 3   | RES              | I      | Reset  | internal pull-up (10k $\Omega$ ), low active |
| 4   | CS               | I      | SPI: Chip Select   | low active                                   |
| 5   | MOSI             | I      | SPI: MOSI  |  |
| 6   | MISO             | 0      | SPI: MISO  |  |
| 7   | CLK              | I      | SPI: Clock   |  |
| 8   | RxD              | L      | RS232: Receive Data  | internal Pull-Up (1M $\Omega$ )              |
| 9   | TxD              | 0      | RS232: Transmit Data   |  |

1) Mounted in hardware version Z only (EA PLUGL128-6GTCZ or EA PLUGS102-6GTCZ)

2) only for EA PLUGL128-6 version

#### SERIAL INTERFACES

The module provides 4 serial interfaces, including USB, RS232, SPI and PC. All interfaces are enabled and received data will be put into one receive buffer. A protocol command is provided if an <u>exclusive interface request</u> is requested.

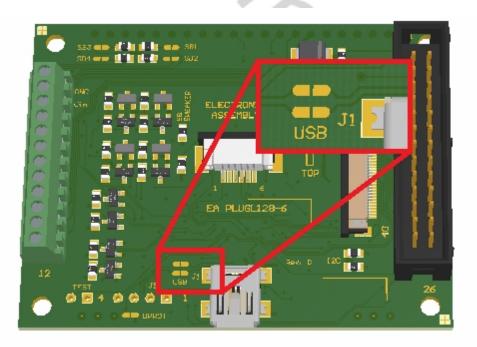

#### USB

The Universal Serial Bus is a serial bus system for interfacing a PC with other peripherals. It's based on differential data transfer. The bus topology is a strict master-slave communication. In the case of EA PLUG-Series the PC/Master needs to coordinate the communication. The module has a CDC (Communications Device Class) and is found by Windows PC's as a virtual COM-Port:

| Description        | Value   |
|--------------------|---------|
| Device Class       | 2       |
| USB Vendor ID      | 0x2DA9  |
| USB Product ID     | 0x0CE4  |
| Device description | EA PLUG |

To program the module, adjust settings or to perform initial tests, we recommend using the USB interface. It's easy to connect, the transfer rate is fast and no interface parameters need to be specified. The driver for Windows can be downloaded on our web-page.

If the USB connection is not to be made via the mini-USB connector (J1) but via the primary connector (J5), two solder bridges must be closed:

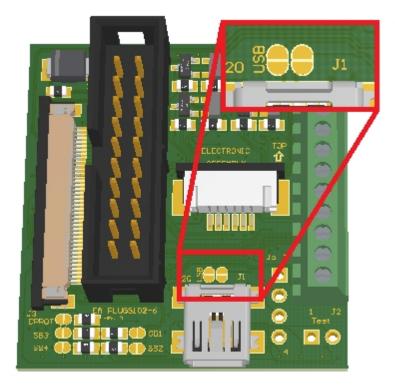

Solder bridge to use the primary connector (EA PLUGL128-6)

# **EA PLUG-Series**

Solder bridge to use the primary connector (EA PLUGS102-6)

The primary connector (J5) pinout is compatible with the PC mainboard pinout (Note polarity).

| Pin | Symbo<br>I | Description |
|-----|------------|-------------|
| 1   | VBUS       | +5V         |
| 2   | D-         | Data -      |
| 3   | D+         | Data +      |
| 4   | GND        | Ground 0V   |

#### Attention:

A <u>protocol</u> has to be used in USB CDC mode. It's impossible to use the USB interface without a protocol, which means the solder bridge (DPROT) must be kept open. Otherwise the high-speed connection of USB leads to buffer overflow.

#### **RS232**

RS232 is a standard for a serial interface. The transmission is serially asynchronous. Thus the data is converted into a bit stream and transmitted. There is no clock signal, so every bus user must work with the same transmission rate (so-called baud rate). RS232 is a voltage interface, such that data is transmitted using changing voltage levels. RS232 consists of "listening" and "talking" lines that are crossed between the two parties. The PLUG fits for direct connection to a RS-232 interface with CMOS level (in the case of EA PLUG-Series **3.1 V**). If you have an interface with another level, an external levelshifter is needed.

In the EA PLUG-Series, the data format is fixed to 8-N-1:

|  | Startbit | DO | ( D1 ) | D2 ) | <b>D3</b> 🛛 | <b>D4</b> ) | D5 🛛 | D6 ) | D7 | Stopbit |  |
|--|----------|----|--------|------|-------------|-------------|------|------|----|---------|--|
|--|----------|----|--------|------|-------------|-------------|------|------|----|---------|--|

#### The EA PLUG-Series works with the following baud rates.

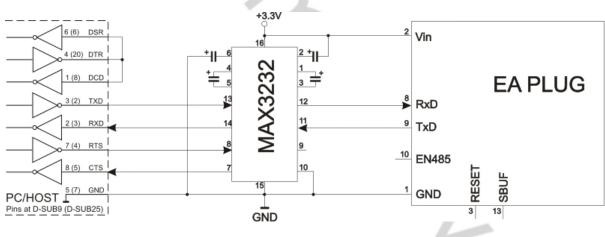

| Baud   | Error |
|--------|-------|
| 2400   | +0.16 |
| 4800   | +0.16 |
| 9600   | +0.16 |
| 19200  | +0.16 |
| 38400  | +0.16 |
| 57600  | +0.16 |
| 115200 | +0.16 |

The parameter (baud rate) is set using command  $\frac{\#+R}{R}$  (higher-level control unit).

#### Application notes

#### **RS232 with levelshifter:**

In the PC world and industrial controls, levels of + 12V and - 12V are defined as standard. With boards or micro-controllers levels of 0V and VDD (in the case of EA PLUG-Series 3.1 V) are common. To adjust the signal levels, there are some possibilities in the form of level shifters (e.g., ICL3232, MAX3232).

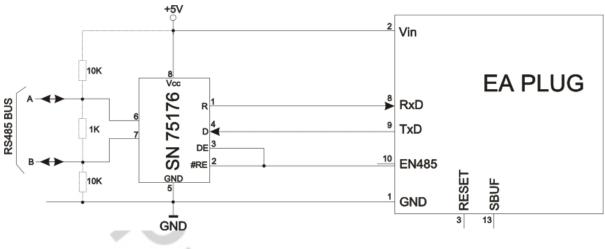

RS232 V24 - Interface to a PC (EA PLUG-Series as slave)

#### RS485/RS422 interface:

With an external converter (e.g. SN75176), the EA PLUG-Series can be connected to a 2-wire RS-485 bus. Large distances of up to 1200m can thus be implemented (remote display). Several EA PLUG-Series displays can be operated on a single RS-485 bus by setting addresses (command  $\frac{\#+R}{}$ ).

RS485 - Interface to a PLC (EA PLUG-Series as slave)

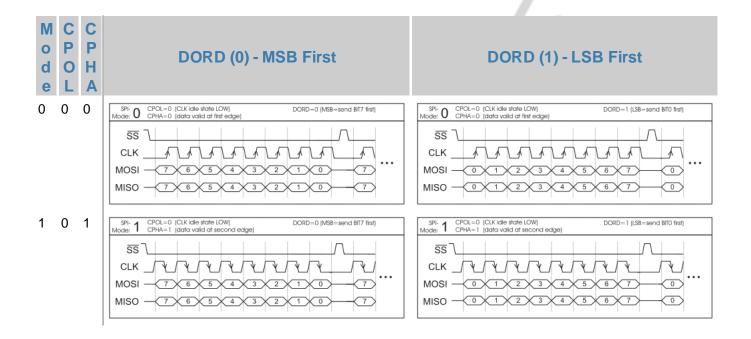

#### SPI

The **S**erial **P**eripheral Interface is a bus system for serial synchronous data transfer, working with 4 lines:

- MOSI (Master Out → Slave In) or SDO (Serial Data Out) or DO
- MISO (Master In ← Slave Out) or SDI (Serial Data In) or DI
- SCK (Serial Clock) Shift clock
- SS (Slave Select  $\rightarrow$  Addressing) or CS (Chip Select)

SPI works with a bidirectional transmission principle, meaning that data is exchanged between the connected devices at the same time. The communication is controlled by the master using the SCK line.

The protocol for data transfer is not defined in SPI, therefore there are different configuration possibilities, which are defined by the parameters Clock Polarity, Clock Phase and Data Order. The default setting is SPI mode 3 with DORD = 0. The command  $\frac{\#+S}{\#+S}$  set the mode 0..3. Alternatively the command can be stored directly into the <u>PowerOn macro</u>.

|                  |                  |                  | LAY<br>SSEMBLY<br>DNS EAPLUG-S  | Series Retection Control Contr |

| 3                | 1                | 1                | SPI-3         CPCL=1         (CLK idle state HIGH)         DORD=0 (MS8-send BIT7 frst)           Mode:         3         CPHA=1         (data valid at second edge)         Idata valid at second edge)           SS  | $\begin{array}{c c} SPi-3 & CPOL=1 (CLK idle state HIGH) & DORD=1 (LS8=send BIID first) \\ \hline Mode: 3 & CPHA=1 (data valid at second edge) \\ \hline SS & \\ CLK & A & A & A & A & A & A \\ MOSI & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 0 \\ \hline MISO & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 0 \\ \hline \end{array}$   |

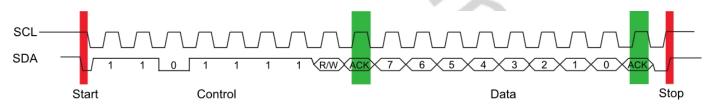

The maximum clock frequency is 1MHz. The module needs some time to prepare data for transfer. That means a wait cycle (no activity on the SCK-line) of at least **50µs** is required before reading data.

l<sup>2</sup>C

<sup>PC</sup> stands for Inter-Integrated **C**ircuit and is a serial data-bus developed by Phillips. The bus is a Master-Slave implementation and needs 2 signal lines:

- SCL (Serial Clock Line)
- SDA (Serial Data Line)

The electrical specification defines that both lines are terminated with a pull-up resistor at VDD, because all devices connected to the bus have open collector outputs. The bus clock is always given by the master, which controls the entire communication:

After the start condition, the slave address follows. In this case, bit 0 is the so-called R/W bit and determines whether the slave should be read (1) or data is transmitted (0). The data exchange takes place until the master executes the stop condition. More detailed information can be found in the PC specification. The default PC bus address is 0xDE (as 7-Bit address without R/W bit it's 0x6F) when writing to the slave unit. The command  $\frac{\#+1}{2}$  can change the PC write address to any other address. Alternatively the command can be written directly into the PowerOn macro.

The maximum frequency is 400kHz. The module needs some time to prepare data for transfer. That means a wait cycle (no activity on the SCL-line) of at least **50µs** is required before reading data.

#### **IN-AND OUTPUTS**

The EA PLUG-Series has 8 digital in- or outputs (CMOS level, non-floating). They can be redefined freely.

**Note**: I/O 5 can be used as PWM output.

#### Inputs (I/O 1-8)

As status on delivery, all ports are defined as inputs. Each input provides an internal pull-up resistor, so it is possible to connect a key or switch directly between input and GND. The inputs can be queried and evaluated directly via the serial interface ( $\frac{\#YR}{}$ ). In addition to that every port change may start an individual port - or bit- macro. The

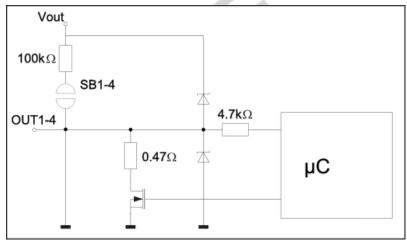

command  $\frac{\#YA}{P}$  activates or deactivates automatic port query. Every alteration of inputs firstly calls bit macros and afterwards port macros. If there is no macro defined, the new status is transfered into the send buffer (<ESC>P).

**Note**: The logic circuitry is designed for slow operations; in other words, more than 3 changes per second cannot be executed.

#### Output (I/O 1-4 / High power)

The command  $\frac{\#YM}{W}$  redefines one or several inputs as outputs. Each line can be controlled individually using the  $\frac{\#YW}{W}$  command. These port pins already hold an internal MOSFET (max. 360mA)

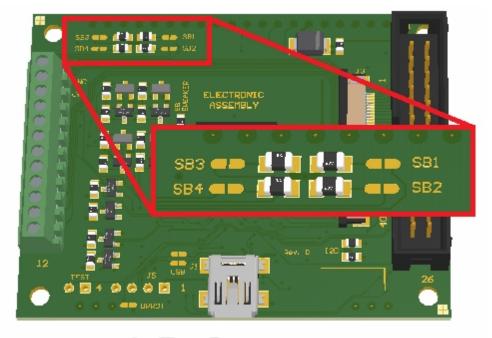

**Note**: Close the solder bridges (SB1-SB4) when you want to use the internal pull ups (100k $\Omega$ ).

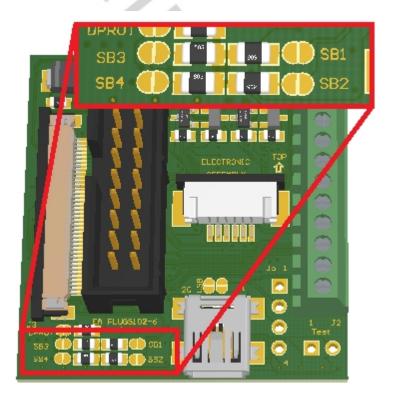

I/O port wiring (Port 1-4)

Solder bridges for I/O ports 1-4 (EA PLUGL128-6)

Solder bridges for I/O ports 1-4 (EA PLUGS102-6)

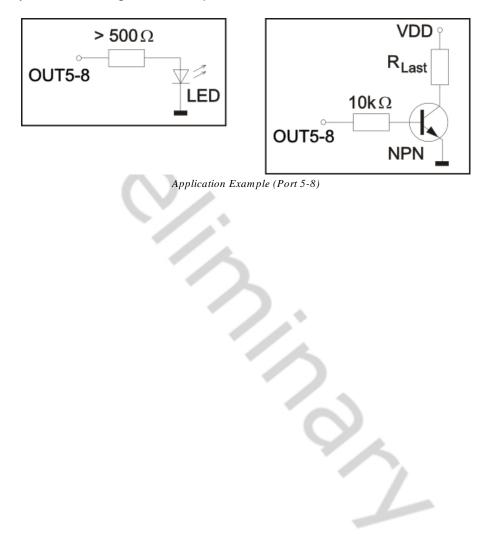

## Output (I/O 5-8 / Low power)

The command  $\frac{\#YM}{W}$  redefines one or several inputs as outputs. Each line can be controlled individually using the  $\frac{\#YW}{W}$  command.

A maximum current of 5mA can be switched per line. This give the opportunity to drive a low power LED in direct way. To source higher current please use an external transistor.

#### PWM

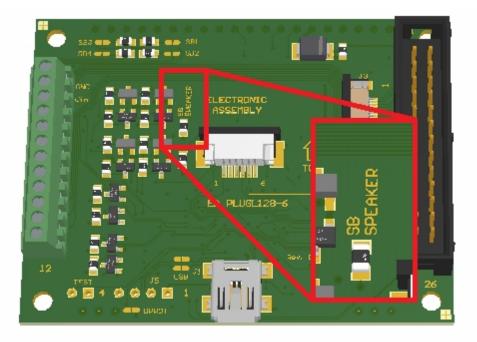

The module has the option of controlling external components via a PWM signal (pulse width modulation). Output Pin of the PWM signal is I/O Port 5. At constant frequency (adjustable from 2 Hz to 24 kHz <u>#YO</u>), the duty cycle of a rectangular pulse is changed. Modulation changes the ratio between the on- and off-time and thus the characteristics of the output signal. In this way, electromechanical components such as motors can be driven or even a quasi-analogue voltage can be generated. The variation of the duty cycles supports a low engine speed/voltage with a short start-up time or a high motor speed/voltage with a long start-up time. The output level is at 0V and Vin.

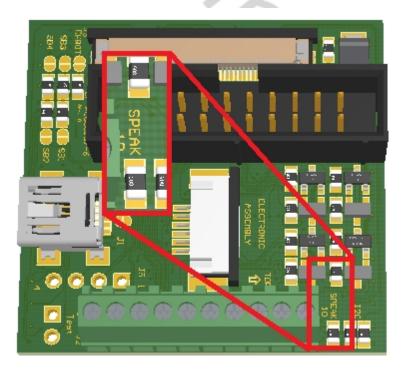

## **EXTERNAL SPEAKER**

The EA PLUG-Series comes with a speaker. You can connect your own speaker if it is to silent. For this, pin 29 or pin 30 (power) are used (see following application examples). Internal speaker is deactivated by removing the  $0\Omega$  resistor (SB Speaker).

Solder bridge for external speaker (EA PLUGL128-6)

Solder bridge for external speaker (EA PLUGS102-6)

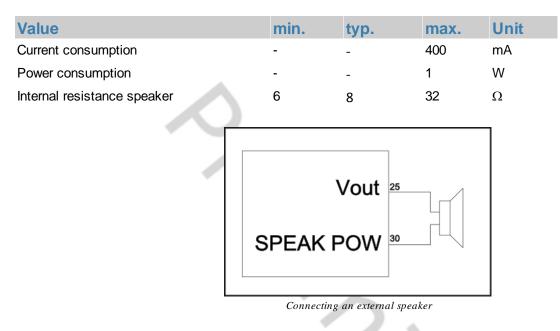

#### Application examples:

### Connecting an external speaker:

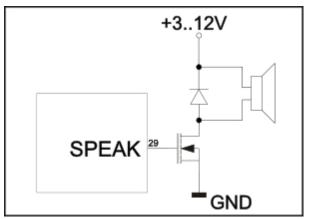

An external speaker can be connected directly to the pins V<sub>out</sub> and SPEAK POW. The following maximum values must not be exceeded.

### Connecting an external speaker with more power:

If you want to increase the volume further you need an additional control circuit with its own power supply.

| Value                                      | min. | typ. | max. | Unit |
|--|------|------|------|------|
| Output voltage V <sub>speak</sub> (Pin 29) | -    | -    | 3,1  | V    |
| Duty cycle                                 | -    | 50   | -    | %    |
| Frequency                                  | -    | 4    | -    | kHz  |
|  |      |      |      |      |

Connecting an external speaker with its own control circuit

#### SOFTWARE

This display is programmed by means of commands, such as draw a rectangle from (0,0) to (64,15). No additional software or drivers are required. Strings and images can be placed with pixel accuracy. Text and graphics can be combined at any time. Different character sets can be used at same time. Each character set and the images can be zoomed from 2 to 4 times and rotated in 90° steps. With the largest character set, the words and numbers displayed will fill the screen.

1 

## LAYERS

The EA PLUG-Series has two different layers:

- Terminal layer
- Graphic layer

The terminal layer can be used for first steps and debugging. When you switch the unit on, the terminal layer is active and the cursor flashes in the first line, indicating that the display is ready for operation. All the incoming characters are displayed in ASCII format on the terminal (exception: CR,LF,FF,ESC, #). The prerequisite for this is a working protocol frame or a deactivated protocol. Line breaks are automatic or can be executed by means of the 'LF character. If the last line is full, the contents of the terminal scroll upward. The 'FF character (page feed) deletes the terminal. The character '# is used as an escape character and thus cannot be displayed directly on the terminal. If the character '# is to be output on the terminal, it must be transmitted twice: '##. The terminal is entirely independent of the graphic outputs. If the graphics screen is deleted with <u>#DL</u>, for example, that does not affect the contents of the terminal window.

The terminal font is fixed in the ROM and can also be used for graphic outputs 'ESC Z... (set FONT nr=0).

Terminal font

All other integrated commands are displayed in the graphic layer. Each command begins with ESCAPE or HASH followed by one or two command letters and then parameters. There are two ways to transmit commands:

## ASCII mode

- Each command starts with the character '#' (hex; \$23, dec: 35).
- The command letters follow directly after the '# character.
- The parameters are transmitted as plain text (several ASCII characters) followed by a separating character (such as a comma ', ), also after the last parameter e.g.: #GD0,0,159,103,
- Strings (text) are written directly without quotation marks and concluded with CR (hex: \$0D) or LF (hex: \$0A).

#### Binary mode

- Each command starts with the character ESC (hex: \$1B, dec: 27).
- The command letters are transmitted directly.
- The coordinates x and y and all other parameters are transmitted as 8bit binary values.
- Strings (text) are concluded with CR (hex: \$0D) or LF (hex: \$0A) or NUL (hex: \$00).

No separating characters, such as spaces or commas, may be used in binary mode. The commands require no final byte, such as a carriage return (apart from the string \$00).).

rĉ

#### **BLINK MODE**

After power on or the command 'ESC DG 0' the EA PLUG-Series is in blink mode. Two picture contents are alternatly shown in an adjustable period.

Blink attributes are set by the commands <u>#ZB</u>, <u>#UB</u>, <u>#GB</u>':

- n1=0: no blink
- n1=1: On/Off blink
- n1=2: blink inverted
- n1=3: Off/On blink (phase shifted)

Between strings (<u>#ZL, #ZC, #ZR</u>), flashing can be activated locally:

- Strings between two '~ (\$7E) mean blink on/off.
- Strings between two '& (\$26) mean blink off/on phase shifted.
- Strings between two '@' (\$40) mean blink inverted.

In addition you can assign or delete postly an rectangle area a blink mode, by using the command 'ESC Q...'

ELECTRONICASSEMBLY reserves the right to change specifications without prior notice. Printing and typographical errors reserved.

#### FONTS

Apart from the 8x8 terminal font (font no. 8), 3 additional monospaced fonts, 3 proportional fonts and 1 large numeric font are integrated as standard. The proportional fonts result in a more attractive appearance, and at the same time require less space on screen (e.g. the "i" is narrow and the "W" is wide). Each character can be positioned with pixel accuracy and the width and height can be scaled. Each text can be output left justified, right justified or centered. 90°/ 180° and 270° rotation is also possible. Macro programming permits additional fonts to be integrated (up to 15). This is done using the LCD-Tools).

#### Preloaded fonts

# Additional fonts

The KitEditor can be used to include additional fonts.

• Compile statement WinFont:

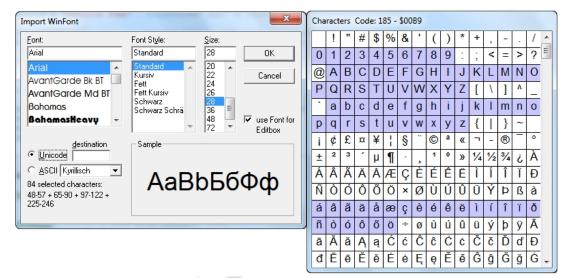

It is possible to raster TrueType-Fonts in different sizes witch can be used. A doubleclick to the fontname within the KitEditor opens the font selection box. To simplify the use of fonts, there is the possibility of an edit box. If you output a string with KitEditor (e.g. #ZL 5,5, "Hello"), you can perform a double click on the string to open it. Now you can select the desired characters. This is mainly recommended using cyrillic, asian or symbol fonts. In that way, the KitEditor automatically places the right ASCII-Code. Alternatively you can use instead of the quotation

mark curly brackets (e.g. #ZL 5,5, {48656C6C6F}).

 Compiler option Font: All \*.FXT font files can be used

Import WinFonts

#### **TOUCH PANEL**

The -xxxTC version is shipped with a capacitive touch panel. Up to 40 touch areas (keys, switches, menus, bar graph inputs) can be defined simultaneously. The touch sensitive area can be defined by pixel accuracy. The display supports user-friendly commands When the touch "keys" are touched, they can be automatically inverted and an external tone can sound (pin 29/30), indicating they have been touched. The predefined return code of the "key" is transmitted via the interface, or an internal touch macro with the number of the return code is started instead (see <u>Macro programming</u>).

#### Frames and key Shapes

A frame type can be set by using the Draw frame or Draw frame box command or by drawing touch keys. 16 frame types are available (0 = do not draw a frame). The frame size must be at least 16x16 pixels.

#### Bitmap as keys

Apart from the frame types, which are infinitely scalable, it is also possible to use bitmaps as touch keys or touch switches. You can use the <u>KitEditor</u> to integrate your own buttons as images (**PICTURE** compiler statement). A button always consists of two monochrome Windows BMPs of equal size (one bitmap to display the touch key in its normal state and one for when it is pressed). The active area of the touch key automatically results from the original size of the button bitmaps.

#### Switches in groups (Radio group)

Touch switches (radio buttons) change their status from ON to OFF or vice versa each time they are touched. Several touch switches can be included in a group (#AR command). If a touch switch in the group 'nr is switched on, all the other touch switches in this group are automatically switched off. Only one switch is ever on.

#### MACRO PROGRAMMING

Single or multiple command sequences can be grouped together in macros and stored in the data flash memory. Then you can start them by using the Run macro commands. The <u>KitEditor</u> is used to program such macros. There are different types of macros (compiler directive marked in green letters):

• Normal macro Macro:

These are started by means of an <u>#MN</u> command via the serial interface or from another macro. A series of macros occurring one after the other can be called cyclically (movie, hourglass, multipage help text). These automatic macros continue to be processed until either a command is received via the interface or a touch macro with a corresponding return code is activated.

- <u>Touch macro</u> TouchMacro: Started when you touch/release a touch field (only in versions with a touch panel - TP) or issue an <u>#MT</u> command.
- Menu macro (1 to 255) MenuMacro: Started when you choose a menu item or issue an <u>#MM</u> command.
- <u>Bit macro BitMacro</u>: will be started by a single line IN 1..8 (bit) will change or by command <u>#MB</u>. Bit- Macro 1..8 are good for falling edge and Bit Macro 9..16 are good for rising edge at input 1..8. It is possible to change the assignment between Bitmacro and intput with command <u>#YD</u>.
- <u>Port macro</u> PortMacro: These are started when voltage (binary) is applied to IN 1..8 or by command <u>#MP</u>.
- <u>Analog macro</u> AnalogMacro: will start whenever voltage changes or limit exceeds or by command <u>#MV</u>.
- <u>Power-on-macro</u> PowerOnMacro: Started after power-on. You can switch off the cursor and define an opening screen, for example.
- Reset-macro ResetMacro: Started after an external reset (low level at pin 3).
- Watchdog-macro WatchdogMacro: Started after a fault/error (e.g. failure).

**Important**: If a continuous loop is programmed in a power-on, reset or watchdog macro, the display can no longer be addressed. In this case, the execution of the power-on macro must be suppressed. You do this by using the protocol <u>break command</u>.

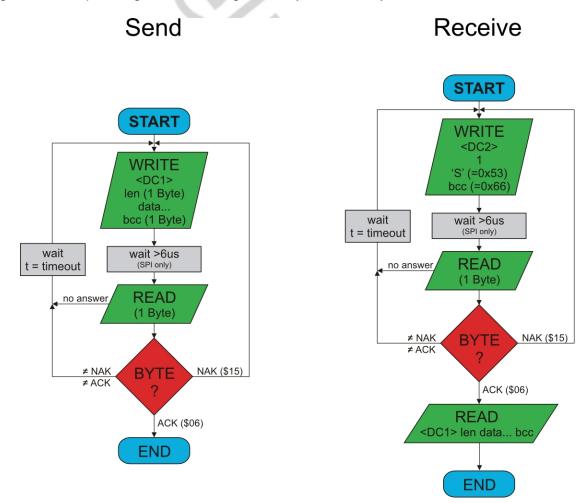

#### **PROTOCOL / DATA TRANSFER**

The transmission protocol is identical regardless which of the 4 serial interfaces is used to transfer data from the higher-level controller. The hardware circuit for each interface varies, which is described under the chapter serial interfaces.

The data transfer is embedded in a fixed frame with a checksum (protocol package). The EA PLUG-Series acknowledges this package with the character <ACK> (=\$06) on successful receipt or <NAK> (=\$15) in the event of an incorrect checksum or receive buffer overflow. In the case of <NAK>, the entire package is rejected and must be sent again. Receiving the <ACK> byte means only that the protocol package is ok, there is no syntax check for the command.

**Note**: It is neccessary to read the <ACK> byte in any case. If the host computer does not receive an acknowledgment, at least one byte is lost. In this case, the set timeout has to elapsed before the package is sent again.

The raw data volume per package is limited to 128 bytes (len <=128). Commands longer than 128 bytes (e.g. Load image ESC UL...) must be split up between a number of packages. All data in the packages are compiled again after being correctly received by the EA PLUG.

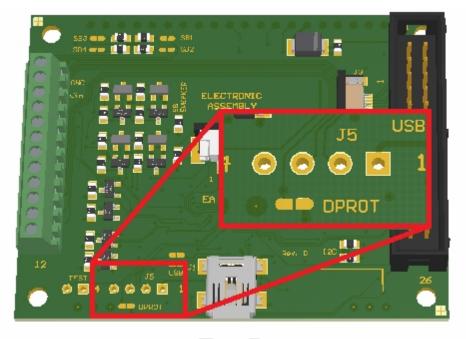

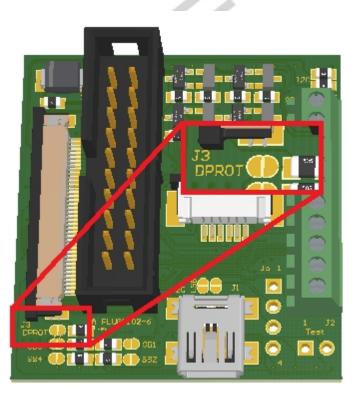

## Deactivation the small protocol

For tests the protocol can be switched off by closing the solder bridge DPROT. In normal operation, however, you are urgently advised to activate the protocol. If you do not, any overflow of the receive buffer will not be detected.

Solder bridge to deactivate small protocol (EA PLUGL128-6)

Solder bridge to deactivate small protocol (EA PLUGS102-6)

Note: Do not deactivate the protocol when using USB as communication interface.

#### Small Protocol commands

The user data is transferred framed by <DC1>, the number of bytes (len) and the checksum (bcc). The display responds with <ACK>.

#### 1. Transfer commands or data to EA PLUG-Series

This protocol command transfers data to the display. Several graphics commands can be packaged in a protocol package. If the data is larger than the maximum packet size, the data can be split into several packets. The module reassembles the individual data packets.

| Module receives | DC1         | length (8 Bit) | Data | bcc (8 Bit) |
|-----------------|-------------|----------------|------|-------------|
|                 | 0x11        | 0xXX           | 0x   | 0xXX        |
| Module sends    | ACK<br>0x06 |                |      |             |

## 2. Request data of send buffer

If data is generated in the module, it is stored in the module's send buffer. The data can be requested via the serial interfaces. Whether data is available can be monitored via the pin 13 SBUF, or the higher-level controller can cyclically poll the data.

| Module receives | DC2  | length (8 Bit) | 'S'  | bcc (8 Bit) |
|-----------------|------|----------------|------|-------------|
|                 | 0x12 | 0x01           | 0x53 | 0x66        |
| Module sends    | ACK  |                |      |             |
|                 | 0x06 |                |      |             |
| Module sends    | DC1  | length (8 Bit) | Data | bcc (8 Bit) |
|                 | 0x11 | 0xXX           | 0x   | 0xXX        |

#### 3. Repeat last data packet

If a received packet of the module is faulty (wrong length or checksum) it can be requested again:

| Module receives | DC2         | length (8 Bit) | 'R'  | bcc (8 Bit) |
|-----------------|-------------|----------------|------|-------------|
|                 | 0x12        | 0x01           | 0x52 | 0x65        |
| Module sends    | ACK<br>0x06 |                | ·    |             |
| Module sends    | DC1         | length (8 Bit) | Data | bcc (8 Bit) |
|                 | 0x11        | 0xXX           | 0x   | 0xXX        |

#### 4. Request buffer information

This command queries whether user data is ready (= Pin 13 SBUF) and also indicates how much free space is left in the device's receive buffer.

| Module receives | DC2<br>0x12 | length (8 Bit)<br>0x01 | 'l'<br>0x49 |  | bcc (8<br>Bit)<br>0x5C |
|-----------------|-------------|------------------------|-------------|--|------------------------|
| Module sends    | ACK<br>0x06 |                        |             |  |                        |
| Module sends    | DC2<br>0x12 | length (8 Bit)<br>0x02 |             | receive buffer bytes<br>free (8 Bit)<br>0xXX | bcc (8<br>Bit)<br>0xXX |

## 5. Protocol settings

This can be used to limit the maximum packet size that the display may send. As default a packet size with up to 64 bytes of user data is set. Furthermore, the time-out can be set in 1 / 100s. The time-out is activated when individual bytes have been lost. After the timeout, the entire packet will be

#### flashed and must be retransmitted.

| Module receives<br>Default values | DC2<br>0x12 | length (8 Bit)<br>0x03 | 1.1.3. | Ibutter (8 Rit) | Time-out (8 Bit)<br>in 1/100s<br>0xC8 (=2<br>seconds) | bcc (8 Bit)<br>0x20 |
|-----------------------------------|-------------|------------------------|--------|-----------------|---|---------------------|
| Module sends                      | ACK<br>0x06 |                        |        |                 |   |                     |

#### 6. Protocol information

Request protocol settings (see 5.).

| Module receives | DC2<br>0x12 | length (8 Bit)<br>0x01 | 'P'<br>0x50  |   |                                   | bcc (8 Bit)<br>0x63 |
|-----------------|-------------|------------------------|--|---|-----------------------------------|---------------------|
| Module sends    | ACK<br>0x06 |                        |  |   |                                   |                     |
| Module sends    | DC2<br>0x12 | length (8 Bit)<br>0x03 | maximum<br>packet size<br>send buffer (8<br>Bit)<br>0x80 | packet size<br>send buffer (8<br>Bit)<br>0xXX | Time-out (8 Bit)<br>in ms<br>0xXX | bcc (8 Bit)<br>0xXX |

#### 7. RS485 address select / deselect

With this command, a module can be selected or deselected on the RS485 bus. By default, the module with address 0x7 is always active.

| Module receives | DC2  | length (8 Bit)         | 'A'  | 'S' (=select)<br>'D' (=deselect) | RS485-address | bcc (8 Bit) |
|-----------------|------|------------------------|------|----------------------------------|---------------|-------------|
| Default values  | 0x12 | 0x03                   | 0x41 | 0x53 or 0x44                     | 0xXX          | 0xXX        |
|                 | ACK  | $\rightarrow$ select   |      |                                  |               |             |
| Module sends    | 0x06 |                        |      |                                  |               |             |
|                 |      | $\rightarrow$ deselect |      |                                  |               |             |

#### 8. RS485 enable signal - delay

Some RS485 masters take some time to change the enable signal, e.g. to switch from write to read mode. In order to enable successful communication with these devices, this command can be used to delay switching to write mode.

| Module receives<br>Default values | DC2<br>0x12 | length (8 Bit)<br>0x03 |  | bcc (8 Bit)<br>0x69 |
|-----------------------------------|-------------|------------------------|--|---------------------|
| Module sends                      | ACK<br>0x06 |                        |  |                     |

## 9. Request interface exclusively

All 4 serial ports are handled in parallel and equivalently after reset. To ensure that a sequence of protocol packets is executed without interruption, the other serial interfaces can be disabled so the active interface can communicate with the module exclusively. This is useful, for example, for a project update via USB to prevent any interruption.

# **EA PLUG-Series**

| Module receives | DC2<br>0x12 | length (8 Bit)<br>0x02 | 'G'<br>0x47  | 0x00 = Release<br>0x01 = Request | bcc (8 Bit)<br>0xXX |
|-----------------|-------------|------------------------|--|----------------------------------|---------------------|
| Module sends    | ACK<br>0x06 |                        |  |                                  |                     |
| Module sends    | DC2<br>0x12 | length (8 Bit)<br>0x01 | active (8 B<br>0x00 = all<br>0x01 = RS<br>0x02 = SP<br>0x03 = IIC<br>0x04 = US | 232<br>I                         | bcc (8 Bit)<br>0xXX |

## 10. Break-Command, Break / Stop execution

If a continuous loop has been programmed in a macro or if a normal process flow is blocked, this command can be used to interrupt and quit. This command is also suitable for update processes.

| Module receives | DC2  | length (8 Bit) | 'C'  | break  | bcc (8 Bit) |
|-----------------|------|----------------|------|--|-------------|
| Default values  | 0x12 | 0x02           | 0x43 | 0x01 = Wait command<br>0x02 = actual macro file<br>0x04 = Clear send buffer<br>0x08 = Clear receive buffer<br>0x10 = Stops automatic port and<br>analog scan | 0xXX        |
|                 |      |                |      | 0xFF = Stops everything  |             |
| Module sends    | ACK  |                | ~    |  |             |
|                 | 0x06 |                |      | <u>^</u>   |             |

### 11. Software Reset

The module is restarted with this protocol command. Depending on the parameter, various start options can be selected to automatically run after the reset.

| Module receives<br>Default values | DC2<br>0x12 | length (8 Bit)<br>0x02 |          | Option<br>0x00 = normal restart<br>0x01 = Restart with test mode<br>0x02 = Restart without running<br>PowerOnMacro macro | bcc (8 Bit)<br>0xXX |
|-----------------------------------|-------------|------------------------|----------|--|---------------------|
| Module sends                      | ACK<br>0x06 |                        | <u> </u> |  | II                  |

## **BCC-Calculation**

The calculation of the checksum requires a simple 8-bit sum test (modulo 256). The following is a typical C implementation.

```
//----
//function: buffer2bcc()
//input: ptr data, block length
//output: Byte bcc
//descr: calculate bcc for a buffer
//-----
UBYTE buffer2bcc(UBYTE *dat, UBYTE len)
{
    UBYTE bcc = 0;
    while(len--)
        bcc += *dat++;
    return bcc;
}
```

### **COMMAND SUMMARY**

The commands can be transmitted at runtime via the serial interfaces or stored in so-called macro files on the module's internal FLASH memory. The following tables describe all commands.

### All commands at a glance

| Terminal #                     |  |
|--------------------------------|--|
|                                | Position cursor                                      |
| <u>#TP</u><br>#TC              |  |
| <u>#TC</u>                     |  |
| <u>#TS</u>                     | Save cursor position                                 |
| <u>#TR</u>                     | Restore cursor position                              |
| <u>#TA</u>                     | Terminal off   |
| <u>#TE</u>                     | Terminal on  |
| <u>#TV</u>                     | Output version                                       |
| <u>#TJ</u>                     | Output project name                                  |
| <u>#TI</u>                     | Output information                                   |
| Display #D                     |  |
| <u>#DO</u>                     | Set display orientation                              |
| <u>#DR</u>                     | Reset display  |
| <u>#DL</u>                     | Delete display                                       |
| <u>#DI</u>                     | Invert display                                       |
| <u>#DS</u>                     | Fill display   |
| <u>#DA</u>                     | Switch display off                                   |
| <u>#DE</u>                     | Switch display on                                    |
| <u>#DC</u>                     | Show clipboard                                       |
| <u>#DN</u>                     | Show normal display content                          |
| <u>#DZ</u>                     | Set screensaver                                      |
| #DW                            | Settings for mode 1 (Brightness)                     |
| <u>#DX</u>                     | Settings for mode 2 (Animated image/ Random pattern) |
| <u>#DV</u>                     | Settings for mode 3 (Invert mode)                    |
| <u>#DY</u>                     | Screensaver (Re)-Trigger                             |
| Clipboard a                    |  |
| <u>#CB</u>                     | Save display contents                                |
| <u>#CS</u>                     | Save area  |
| <u>#CR</u>                     | Restore area   |
| <u>#CK</u>                     | Copy area  |
| Line/ Point                    |  |
| <u>#GZ</u>                     | Point size / line thickness                          |
| <u>#GV</u>                     | Graphic link mode                                    |
| #GB                            | Blink attribute                                      |
| #GP                            | Draw point   |

### TERMINAL

In the terminal layer, all received data is displayed directly. This layer is useful for quickly creating simple outputs or receiving error messages during development time.

| Command                      | Codes     | Remarks   |  |
|------------------------------|-----------|---|--|
| Form feed FF (dec: 12)       | ~L        | The content of the screen are deleted and the cursor is placed at pos (1,1) |  |
| Carriage return CR (dec: 13) | <b>^M</b> | Cursor to the beginning of the line on the extreme left                     |  |
| Line feed LF (dec: 10)       | ٩J        | Cursor 1 line lower, if cursor in last line then scroll                     |  |

## Terminal layer settings

| Command                 | Code | s |   |              | Remarks  |     |
|-------------------------|------|---|---|--------------|--|-----|
| Position cursor         |      |   | Р | Column, Line | Origin upper-left corner (1,1)                                   | 1,1 |
| Cursor on/off           |      |   | с | Visibility   | <b>Visibility</b> =0 (Terminal invisible); =1 (Terminal visible) | 1   |
| Save cursor position    | ESC  | т | S |              | The current cursor position is saved                             |     |
| Restore cursor position |      |   | R |              | The last saved cursor position is restored                       |     |
| Terminal off            |      |   | Α |              | Terminal is switched off; outputs are rejected                   |     |
| Terminal on             |      |   | Е |              | Terminal is switched on  | On  |

### **Output informations**

|                      |      |   | 1 |   |  |
|----------------------|------|---|---|---|--|
| Output informations  |      |   |   |   |  |
| Command              | Code | S |   | <br>Remarks   |  |
| Display version      |      |   | V | The version no. is output in the terminal (e.g.<br>"EAPLUG128-6 V1.0 T+")   |  |
| Display project name | ESC  | Т | J | The macro project name is output to the terminal (e.g. "init / delivery state")   |  |
| Display information  |      |   | I | The terminal is initialized and deleted;<br>software version, the macro project name and<br>the CRC-checksum is ouput to the terminal |  |

## **DISPLAY (EFFECT THE ENTIRE DISPLAY)**

| Command                 | Code | S |   |             | Remarks   |   |
|-------------------------|------|---|---|-------------|---|---|
| Set display orientation | ESC  | D | 0 | Orientation | Orientation =0 (0°); =1 (90°); =2 (180°); =3 (270°) | 0 |
| Reset display           |      |   | R |             | Reset the display                                   |   |

### **Display content**

| Command                     | Codes |     |   | Remarks   |    |
|-----------------------------|-------|-----|---|---|----|
| Delete display              |       | L   |   | Delete display contents (all pixels off)  |    |
| Invert display              |       | 1   |   | Invert display contents (invert all pixels)                                     |    |
| Fill display                |       | S   |   | Fill display contents (all pixels on)   |    |
| Switch display off          | ESC   | D A |   | Display content becomes invisible but are retained, commands are still possible |    |
| Switch display on           |       | E   |   | Display content becomes visible again   | On |
| Show clipboard              |       | С   |   | Show content of clipboard; Standard display outputs are no longer visible       |    |
| Show normal display content |       | N   |   | Normal operation, standard display outputs are visible                          |    |
| <u>Screensaver</u>          |       |     | 2 |   |    |
| Command                     | Codes |     |   | Remarks   |    |

### Screensaver

| Command   | Code | S    |   |  | Remarks  |   |  |
|---|------|------|---|--|--|---|--|
| Set screensaver   | ESC  |      | Z | Mode, Mask                                       | Set the screensaver <b>Mode</b> =0 (No<br>screensaver); = 1 (change display brightness);<br>= 2 (Animated images/ Random pattern); =3<br>(invert display) and the retrigger <b>Mask</b> = \$01<br>(Touch); =\$2 (USB); =\$4 (RS232); =\$8 (SPI);<br>=\$16 (I <sup>2</sup> C) | 0   |  |
| Settings for mode 1<br>(Brightness)                       |      |      |   | W  | ttTime1 <sup>1)</sup> ,<br>Bright1,<br>ttTime2 <sup>1)</sup> ,<br>Bright2  | If screensaver mode 1 is active (#DZ1,)<br><b>ttTime1</b> and <b>TtTime2</b> (16-Bit) sets the time in<br>seconds, when the brightness ( <b>Bright1</b> and<br><b>Bright2</b> ) is active. The value of brightness is<br>relative to the actual brightness (0150%). |  |
| Settings for mode 2<br>(Animated image/Random<br>pattern) |      | SC D | x | Type, ttTime <sup>1)</sup>                       | If screensaver mode 2 is active (#DZ2,)<br><b>Type</b> sets the kind of animation<br><b>Type</b> =0 (Random pattern/starlit sky);<br>=1255 (Animated image 1255)<br><b>ttTime</b> (16-Bit) sets the start time in seconds  |   |  |
| Settings for mode 3 (Inverse mode)                        |      |      | v | ttTime1 <sup>1)</sup> ,<br>ttTime2 <sup>1)</sup> | If screensaver mode 3 is active (#DZ3,)<br><b>ttTime1</b> (16Bit) sets the start time in seconds<br>and <b>ttTime2</b> (16Bit) the inverting time in<br>seconds  |   |  |
| Screensaver (Re)-Trigger                                  |      |      | Y | Option   | <b>Option</b> =0 (Trigger/Start screensaver); =1<br>(Retrigger screensaver)  |   |  |

1) 16-bit value range (for binary transmission first low then high byte)

### **CLIPBOARD**

| Command               | Code | S |   |                | Remarks   |  |
|-----------------------|------|---|---|----------------|---|--|
| Save display contents |      |   | В |                | The entire contents of the display are copied to the clipboard as an image area               |  |
| Save area             | ESC  | С | S | x1, y1, x2, y2 | The image area from <b>x1</b> , <b>y1</b> to <b>x2</b> , <b>y2</b> is copied to the clipboard |  |
| Restore area          |      | C | R |                | The image area on the clipboard is copied back to the display                                 |  |
| Copy area             |      |   | К | х, у           | The image area on the clipboard is copied to <b>x</b> , <b>y</b> in the display               |  |
|                       |      |   | 0 | 3              |   |  |

2

## LINE/ POINT/ BOX

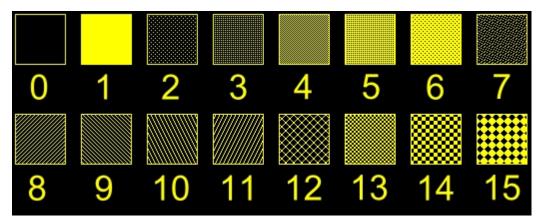

### Straight lines and points

| Command                     | Code | S |   |                | Remarks  |     |
|-----------------------------|------|---|---|----------------|--|-----|
| Point size / line thickness |      |   | Z | n1, n2         | <b>n1</b> = x-point size (115); <b>n2</b> = y-point size (115)                                   | 1,1 |
| Graphic mode                | ESC  | G | V | Mode           | Set drawing <b>Mode</b> =1 (set); =2 (delete); =3 (inverse)                                      | 1   |
| Blink attribute             |      |   | В | Mode           | Set blink <b>Mode</b> =0 (no blink); =1 (on/off); =2 (blink inverted); =3 (off/on phase shifted) | 0   |
| Draw point                  |      |   | Р | х, у           | Set a point at coordinates <b>x</b> , <b>y</b>   |     |
| Draw straight line          |      |   | D | x1, y1, x2, y2 | Draw a straight line from <b>x1</b> , <b>y1</b> to <b>x2</b> , <b>y2</b>                         |     |
| Continue straight line      | ESC  | G | w | х, у           | Draw a straight line from the last end point to <b>x</b> , <b>y</b>                              | 0,0 |
| Draw rectangle              |      |   | R | x1, y1, x2, y2 | Draw four straight lines as a rectangle from x1, y1 to x2, y2                                    |     |

...

## **MENU/ TOUCHABLE**

## Settings for menu box/touch menu

| Command                 | Code | S     |   |         | Remarks   |     |
|-------------------------|------|-------|---|---------|---|-----|
| Set menu font           |      |       | F | n1      | Set font with the number $n1 = 015$ for menu display  | 0   |
| Menu font zoom factor   |      |       | Z | х, у    | <b>x</b> = x-zoom factor (14); <b>y</b> = y-zoom factor (14)  | 1,1 |
| Additional line spacing | ESC  | ESC N | Y | Spacing | Insert <b>Spacing</b> = 015 dots between two<br>lines as additional spacing   | 0   |
| Menu angle              |      |       | W | Angle   | Menu display <b>Angle</b> =0 (0°); =1 (90°)   | 0   |
| Touch menu automation   |      |       | Т | Туре    | <b>Type</b> =1: (Touchmenu opens automatically);<br>=0 (Touchmenu doesn't open automatically,<br>instead the request 'ESC T0' is sent to the<br>host, which can then open the touch menu<br>with 'ESC NT2') | 1   |

# Menu box commands (control not by touch)

| Command                 | Code | S |   |                        | Remarks   |  |
|-------------------------|------|---|---|------------------------|---|--|
| Define and display menu | ESC  | Ν | D | x, y, n1, Text,<br>NUL | A menu is drawn at the corner <b>x</b> , <b>y</b> witch the<br>current font of menu<br><b>n1</b> = currently inverted entry (e.g. 1 = first<br>entry)<br><b>Text</b> = string with menu items. The different<br>items are seperated by the character<br>' ' (\$7C,dez:124) e.g. "Item1 Item2 Item3"<br>The background of the menu is automatically<br>saved into the clipboard (previous contend will<br>be<br>overwritten).<br>If a menu is already defined, it is<br>automatically canceled and deleted |  |
| Next item               |      |   | N |                        | The next item is inverted or remains at the end   |  |
| Previous item           |      |   | Р |                        | The previous item is inverted or remains at the beginning   |  |
| End of menu/ send       |      |   | s |                        | The menu is removed and replaced with the original background. The current item is sent as a number (1 to n; $0 = no$ menu displayed)   |  |
| End of menu/ macro      |      |   | м | n1                     | The menu is removed and replaced with the original background. Menu macro n1 is called for item 1, menu macro <b>n1</b> +1 for item 2 and so on   |  |
| End of menu/ cancel     | ESC  | N | А |                        | The menu is removed and replaced with the original background   |  |

### Additional Menu commands (touchable)

| Command                                | Codes   |   | Remarks  |  |
|--|---------|---|--|--|
| Define touch key with menu<br>function | ESC A M | x1, y1, x2, y2,<br>Down Code, up<br>Code, MNU<br>Code, Text,<br>NUL | The area from <b>x1</b> , <b>y1</b> to <b>x2</b> , <b>y2</b> is defined as a menu key.<br><b>Down Code</b> :(1255) Return/touch macro when pressed.<br><b>Up Code</b> :(1255) Return/touch macro when menu canceled<br><b>MNU Code</b> :(1255) Return/menu macro+(item no. 1) after selection of a menu item. (down/up code = 0: activation/cancellation is not reported.)<br><b>Text:</b> = string with the key text and the menu items. the first character determines the direction in which the menu opens (R=right, L=left, O=up, U=down). The second character determines the alignment of the touch key text (C=centered, L=left justified, R=right justified). The menu items are separated by the character ' ' (\$7C,dec:124) (e.g."uckey  item1 item2 item3". The key text is written with the current touch font and the menu items are written with the current menu font. The background of the menu is saved automatically. |  |

v. iter. The t. automa

### MACRO

Single or multiple command sequences can be collected as so-called macros. The following commands describe how to work with macros:

### Call macros

| Command          | Code | S   |   |         | Remarks   |  |  |  |
|------------------|------|-----|---|---------|---|--|--|--|
| Run normal macro |      |     | Ν | n1      | Call the (normal) macro with the number <b>n1</b> (max. 7 levels) |  |  |  |
| Run touch macro  |      |     |   |         | Т   | n1   | Call the touch macro with the number <b>n1</b> (max. 7 levels) |  |
| Run menu macro   |      | м   | М | n1      | Call the menu macro with the number <b>n1</b> (max. 7 levels)     |  |  |  |
| Run port macro   | ESC  | IVI | P | n1      | Call the port macro with the number <b>n1</b> (max. 7 levels)     |  |  |  |
| Run bit macro    |      |     | В | bittype | Call the bit macro with the <b>bittype</b> (max. 7 levels)        |  |  |  |
| Run analog macro |      |     |   | v       | analogtype  | Call the analog macro with the <b>analogtype</b> (max. 7 levels) |  |  |

|         |                       | (max. |
|---------|-----------------------|-------|
|         |                       |       |
|         | Bit macros            |       |
| bittype | Start the macro at    |       |
| 18      | falling edge (I/O 18) |       |
| 916     | rising edge (I/O 18)  |       |
|         |                       |       |

|       | Analo | og macros                         |        |
|-------|-------|-----------------------------------|--------|
| analo | gtype | Start the macro at                |        |
| AIN1  | AIN2  | Start the macro at                | $\sim$ |
| 0     | 10    | every change of the analog value  |        |
| 1     | 11    | falling analog value              |        |
| 2     | 12    | rising analog value               |        |
| 3     | 13    | smaller than lower limit          |        |
| 4     | 14    | larger than lower limit           |        |
| 5     | 15    | smaller than upper limit          |        |
| 6     | 16    | larger than upper limit           | ĺ      |
| 7     | 17    | outside both limits               |        |
| 8     | 18    | within both limits                |        |
| 9     | 19    | smaller than other analog channel |        |

### Automatically running macros

| Command                        | Code | S     |   |              | Remarks  |  |  |   |              |  |  |
|--------------------------------|------|-------|---|--------------|--|--|--|---|--------------|--|--|
| Macro with delay               |      |       | G | n1, Delay    | Call the (normal) macro with the number <b>n1</b> in <b>Delay</b> /10s. Execution is stopped by commands (e.g. receipt or touch macros)                          |  |  |   |              |  |  |
| Automatic macros once only     |      |       |   |              |  |  |  | E | n1, n2, Time | Automatically run macros <b>n1</b> to <b>n2</b> once only;<br><b>Time</b> = pause in 1/10s. Execution is stopped<br>by commands (e.g. receipt or touch macros) |  |
| Automatic macros<br>cyclically | ESC  | ESC M | A | n1, n2, Time | Automatically run macros <b>n1</b> to <b>n2</b> cyclically;<br><b>Time</b> = pause in 1/10s. Execution is stopped<br>by commands (e.g. receipt or touch macros)  |  |  |   |              |  |  |
| Automatic macros ping pong     |      |       | J | n1, n2, Time | Automatically run macros <b>n1</b> to <b>n2</b> to n1 (ping pong); <b>Time</b> = pause in 1/10s. Execution is stopped by commands (e.g. receipt or touch macros) |  |  |   |              |  |  |

# Macro processes (automatically)

| Command                | Code | s |   |                           | Remarks   |   |
|------------------------|------|---|---|---------------------------|---|---|
| Define macro process   |      |   | D | no, Type, n1,<br>n2, Time | A macro process with the number <b>no</b> (1 to 4)<br>is defined (1=highest priority). The macros <b>n1</b><br>to<br><b>n2</b> are run successuvely every <b>Time</b> /10s.<br><b>Type =</b> 1 (once only); =2 (cyclical); =3 (ping<br>pong n1 to n2 to n1) |   |
| Macro process interval | ESC  | М | z | no, Time                  | A new time <b>Time</b> /10s is assigned to the macro process <b>no</b> (1 to4). If the time <b>Time</b> is set to 0, the execution is stopped.  |   |
| Stop macro processes   |      |   | S | n1                        | All macro processes are stopped with <b>n1</b> =0<br>and restarted with <b>n1</b> =1 in order, for example,<br>to execute settings and outputs via the<br>interface undisturbed.  | 1 |
|                        |      |   |   |                           | 1   |   |

## **GENERAL**

## **Brightness**

| Code | Codes |   |         | Remarks  |  |
|------|-------|---|---------|--|--|
|      |       | @ |         | Save actual brightness on to FLASH   |  |
| ]    |       | Н | Bright  | Set brightness to <b>Bright</b> =0%150%  | 100  |
|      |       | N |         | Increase current brightness  |  |
| ESC  | Y     | Р |         | Reduce current brightness  |  |
|      |       | L | n1      | Brightness <b>n1</b> =0 (off); =1 (on); =2255: The brightness is switched on for <b>n1</b> /10s. | 1  |
|      |       | В | nr      | Change brightness by bargraph number nr  |  |

### I/O/ DIGITAL/ PWM

| Command                 | Code | s |   |  | Remarks   |   |
|-------------------------|------|---|---|--|---|---|
| Read input port         |      |   | R | n1   | n1 =0 (Read all input ports as binary value to sendbuffer); =18 (Read input port n1)  |   |
| Port scan on/off        |      |   | А | n1   | The automatic scan of the input port is n1 =0 (deactivated); =1 (activated)   | 1 |
| Invert input port       |      |   | I | n1   | The input port is n1 = 0 (evaluated normal); =1 (evaluated inverted)  | 0 |
| Redefine input bitmacro | ESC  | Y | D | n1, n2, n3                                 | Input port $n1=18$ is assigned by falling edge<br>n2=0 to BitMacro $n3=0255Input port n1=18 is assigned by rising edgen2=1$ to BitMacro $n3=0255$             |   |
| Define output port      |      |   | М | Mask                                       | Define output ports according binary <b>Mask</b> (1=output; 0=input)  | 0 |
| Write output port       |      | C | w | n1,n2                                      | <pre>n1=0: Set all defined output ports in<br/>accordance with n2 (=binary value)<br/>n1=18: Reset output port n1 (n2=0); set<br/>(n2=1); invert (n2=2)</pre> |   |
| PWM settings            | ESC  | Y | 0 | 0, ffFrequency*,<br>Highphase,<br>Lowphase | Set PWM <b>ffFrequency</b> (16-Bit; 224kHz)<br><b>Highphase</b> / <b>Lowphase</b> = Relation high-time<br>to low-time e.g. 2,1 to get 66% high and 33%<br>low |   |

\*16-bit value range (for binary transmission first low then high byte)

## Port mask (binary):

## ANALOG INPUT/ ANALOG OUTPUT

Command group to parametrize and read the analog input and output of the module. The module has two 12-bit analog inputs and one 8-bit analog output

## Analogue input

| Command                  | Code | S |   |   | Remarks  |       |
|--------------------------|------|---|---|---|--|-------|
| Calibration              | X    |   | @ | Channel, xx1 <sup>1)</sup>                          | Calibration procedure is as follows:<br>1.) Apply defined voltage (13.1V) to AIN1<br>(channel1) or AIN2 (channel2)<br>2.) Run this command with channel<br>information <b>Channel</b> =12 and <b>xx1</b> =voltage<br>value [mV] (16-Bit)<br>e.g. 3.1V on AIN1; Command: '#V@1,3100;  |       |
| Enable/disable AIN scan  |      |   | A | n1  | <b>n1</b> =0 (disables input scan for AIN1 and AIN2);<br>=1 (enable input scan)  | 0     |
| Send analog value        |      |   | D | Channel   | Voltage in [mV] will be sent (to sendbuffer) for <b>Channel</b> =12  |       |
| Limit for analog macro   | ESC  | V | к | Channel, Lower<br>limit, Upper<br>limit, Hysteresis | Sets two limits for <b>Channel</b> =12.<br><b>Lower limit</b> [mV/20]; <b>Upper limit</b> [mV/20];<br><b>Hysteresis</b> [mV]<br>Related to this limits several analog macros<br>can be started automatically.  | 0,0,0 |
| Bargraph for AIN1/AIN2   |      |   | В | Channel, no   | Assigns bargraph <b>no</b> =120 to analogue input<br>channel <b>Channel</b> =12<br>(It is possible to assign more than one<br>bargraph to an analogue input).<br>Define start- end values (aw, ew) forbargraph<br>in [mV/20]   |       |
| Redraw bargraph          |      |   | R | Channel   | Redraw all bargraphs defined for<br>Channel=12   |       |
| Digital value font       |      |   | F | Channel, n1   | Set font <b>n1</b> for channel <b>Channel</b> =12  |       |
| Digital value zoom       |      |   | Z | Channel, x, y                                       | Set zoom factor for <b>Channel</b> =12; <b>x</b> = x-<br>factor (14); <b>y</b> = y- factor (14)  | 1,1   |
| Digital value angle      |      |   | W | Channel, n1   | Set writing angle for <b>Channel</b> ; $n1 = 0$ (0°); =1 (90°)   | 0     |
| Digital values / scaling | ESC  | V | E | Channel, Format<br>string, NUL                      | Set user value for <b>Channel</b> =12.<br><b>Format string</b> :<br>"mV1=uservalue1;mV2=uservalue2".<br>'NUL' (\$00) = termination<br>Assign two voltages (03100mV) to user<br>defined values<br>max. range: 4 1/2 digits 19999 + decimal<br>point ('.' oder ',') + sign<br>e.g. display for 2000 mV input should be "-<br>123.45" and "0.00" for 1000mV<br>Format String: "2000=-123.45;1000=0" |       |
| Send digital value       |      |   | S | Channel   | This will send current voltage as formated string for <b>Channel</b> =12 to sendbuffer   |       |
| Display on terminal      |      |   | Т | Channel   | Show formated string of <b>Channel</b> =12 on terminal layer   |       |
| Show user value          |      |   | G | Channel, x, y                                       | Show formated string of <b>Channel</b> =12 at coordinate <b>x</b> , <b>y</b>   |       |

### Analogue output

| Command                         | Code | s |   |   | Remarks  |  |
|---------------------------------|------|---|---|---|--|--|
| User value font                 |      |   | F   | 128, n1   | Set font <b>n1</b> for analogue output   |  |
| User value zoom                 | ESC  | v | Z   | 128, x, y   | Set zoom factor for analogue output; $\mathbf{x} = x$ -factor (14); $\mathbf{y} = y$ - factor (14)   |  |
| User value angle                |      |   | W         128, n1         Set writing angle<br>(0°); =1 (90°) | Set writing angle for analogue output; $n1 = 0$<br>(0°); =1 (90°) |  |  |
| Set analogue value              | X    |   | 0   | 128, Value,<br>Time, Ramp   | Output 8-Bit analog (Pin 14) Value. Current<br>analog output increases or decreases<br>according to chosen <b>Ramp</b> (=0 linear; =1<br>accelerating $\rightarrow$ linear; =2 linear $\rightarrow$ slowing; =3<br>acceleration $\rightarrow$ linear $\rightarrow$ slowing; =4 User<br>(#VU) in <b>Time</b> /10s |  |
| Define Lookup table (ramp)      |      |   | U   | 128, n1,,n100   | Set 100 values for ramp (range 0100)   |  |
| Bargraph for analogue<br>output | ESC  | v | в   | 128, no   | Assigns bargraph <b>no</b> =120 to analogue<br>output<br>Define start- end values (aw, ew) forbargraph<br>in [mV/20]   |  |
| Send user value                 |      |   | S   | 128   | This will send current output voltage as<br>formated string for to sendbuffer  |  |
| Display on terminal             |      |   | т   | 128   | Show formated string of analogue output on terminal layer  |  |
| Show user value                 |      |   | G   | 128, x, y   | Show formated string of analogue output at coordinate <b>x</b> , <b>y</b>  |  |

1) 16-bit value range (for binary transmission first low then high byte)

## Touch/drawing areas

| Command                | Code | s |   |                       | Remarks  |  |
|------------------------|------|---|---|-----------------------|--|--|
| Define drawing area    | 500  | • |   | x1, y1, x2, y2,<br>n1 | A drawing area is defined. You can then draw<br>with a line width of <b>n1</b> within the corner<br>coordinates <b>x1</b> , <b>y1</b> and <b>x2</b> , <b>y2</b>  |  |
| Define free touch area | ESC  | A | Н | x1, y1, x2, y2        | A freely usable touch area is defined. Touch actions (down, up and drag) within the corner coordinates <b>x1</b> , <b>y1</b> and <b>x2</b> , <b>y2</b> are sent. |  |
|                        |      |   |   |                       |  |  |

## Menu function

| Command                                | Codes   |   | Remarks  |  |
|--|---------|---|--|--|
| Define touch key with menu<br>function | ESC A M | x1, y1, x2, y2,<br>Down Code, up<br>Code, MNU<br>Code, Text,<br>NUL | The area from x1, y1 to x2, y2 is defined as a<br>menu key.<br>Down Code:(1255) Return/touch macro<br>when pressed.<br>Up Code:(1255) Return/touch macro when<br>menu canceled<br>MNU Code:(1255) Return/menu<br>macro+(item no. 1) after selection of a menu<br>item. (down/up code = 0:<br>activation/cancellation is not reported.)<br>Text:= string with the key text and the menu<br>items. the first character determines the<br>direction in which the menu opens (R=right,<br>L=left, O=up, U=down). The second character<br>determines the alignment of the touch key<br>text (C=centered, L=left justified, R=right<br>justified). The menu items are separated by<br>the character ' ' (\$7C,dec:124) (e.g."uckey <br>item1 item2 item3". The key text is written<br>with the current touch font and the menu<br>items are written with the current menu font.<br>The background of the menu is saved<br>automatically. |  |

## Global settings

| Command            | Code | S |   |    | Remarks  |   |
|--------------------|------|---|---|----|--|---|
| Touch query on/off |      |   | А | n1 | Touch query is deactivated ( <b>n1</b> =0 or activated ( <b>n1</b> =1)             | 1 |
| <b>-</b>           | ESC  | A | I | n1 | Automatic inversion when touch key touched:<br>n1=0=Off; n1=1=On;                  | 1 |
| Touch key response |      |   | S | n1 | Tone sounds briefly when a touch key is touched: <b>n1</b> =0=Off; <b>n1</b> =1=On | 1 |

## Bargraph/ Slider

| Command                         | Code | s |   |    | Remarks  |   |
|---------------------------------|------|---|---|----|--|---|
| Set bar by touch                |      |   | В | nr | The bargraph with the number <b>nr</b> is defined for input by touch panel.  |   |
| Send bar value<br>automatically | ESC  | A | Q | n1 | The Automatic transmission of a new bargraph value by touch input is deactivated ( <b>n1</b> =0); a new value is sent after setting ( <b>n1</b> =1); each change is sent during setting ( <b>n1</b> =2). | 1 |

## **Replies**

| Command            | Code | S |   |    | Remarks  |  |
|--------------------|------|---|---|----|--|--|
| Query radio group  | 500  | • | G | nr | The down code of the activated switch from radio group $\mathbf{nr}$ is placed in the sendbuffer |  |
| Query touch switch | ESC  | А | х | nr | The status of the switch (off=0; on=1) is placed in the send buffer.                             |  |

### Delete touch area

| Command           | Cod | es |   |          | Remarks  |  |  |  |
|-------------------|-----|----|---|----------|--|--|--|--|
| Delete touch area | ESC | А  | L | Code, n1 | The touch area with the return <b>Code</b><br>( <b>Code</b> =0: all touch areas) is removed from the<br>touch query.<br>When <b>n1</b> =0, the area remains visible on the<br>display; when <b>n1</b> =1, the area is deleted. |  |  |  |
|                   |     |    | V | x, y, n1 | Remove the Touch area that includes the coordinates <b>x</b> , <b>y</b> from the touch query. <b>n1</b> =0: area remains visible; <b>n1</b> =1: Delete area  |  |  |  |
|                   |     |    |   |          |  |  |  |  |

### REPLIES

The table below contains all response codes. Some response data will come automatically some others on request. In addition to that with command 'ESC SB ...' user is able to transmit individual data packages. All reponses are placed into the sendbuffer. With the smallprotocol command Request for content of send buffer the host can read out the sendbuffer. This can be done per polling, alternatively pin 13 SBUF shows with Low-level that data is ready to transmit.

### Automatic responses (placed into sendbuffer)

| ESC | A          | 1        | Code   | Response from the touch panel when a key/switch is pressed. <b>Code</b> = down or up code of the key/switch. It is only transmitted if no touch macro with the number code is defined!  |
|-----|------------|----------|--|---|
| 500 | Р          | 0        |  | When a bargraph is set by touch, the current value of the bar <b>no</b> is transmitted.<br>Transmission of the bar <b>Value</b> must be activated (see the ' <u>#AQ</u> ' command).   |
| ESC | ESC B 2 no |          | no, Value  | After the ' <u>#BS</u> ' command, the current <b>Value</b> of the bar with the number <b>no</b> is transmitted.   |
| ESC | N          | N 1 Code |  | After a menu item is selcted by touch, the selected menu item <b>Code</b> is transmitted. It is only transmitted if no touch macro is defined with the number <b>Code</b> .   |
|     |            |          |  | After the ' <u><b>#NS'</b></u> command, the currently selected menu item is transmitted.<br><b>Code</b> =0: no menu item is selected.   |
| ESC | т          | 0        |  | If automatic opening of a touch menu is disabled (see ' <u>#NT</u> '), this request is sent to the host computer. The host can then open the touch menu with the 'ESC N T 2' command.   |
| ESC | Ρ          | 1        | Value  | After the input port is changed, the new 8-bit value is transmitted. The automatic port scan must be activated. See the ' <u>#YA</u> command. It is only transmitted when there is no corresponding port/bit macro defined!   |
| ESC | Н          | 3        | Type, x, y   | The following is transmitted in the case of a free touch area event: <b>Type</b> =0: is release; =1: is touch; =2: is drag within the free touch area at the coordinates $x$ , $y$  |
| ESC | Х          | 2        | Code, Value  | After the '#AX' command, the current status ( <b>Value</b> =0 or 1) of the touch switch <b>Code</b> is transmitted.   |
| ESC | G          | 2        | no, Code   | After the ' <u>#AG</u> ' command, the <b>Code</b> of the active touch switch in the radio group <b>no</b> is sent.  |
| ESC | Y          | 2        | no, Value  | After the ' <u>#YR</u> ' command, the requested input port is transmitted. <b>no</b> =0: <b>Value</b> is an 8-bit binary value of all 8 inputs.<br><b>no</b> =18: <b>Value</b> is 0 or 1 depending on the status of the input no  |
| ÊSC | D          | 3        | no, Lo-Value,<br>High-Value  | After the $\frac{\#\sqrt{D}}{}$ command, the currently analogue value of the channel <b>no</b> =12 is sent.<br>( <b>Value</b> = 03100 mV)   |
| ESC | V          | Num      | Version string   | After the ' <u>#SV</u> ' command, the version of the PLUG firmware is transmitted as a string e.g. "EA PLUGL128-6 V1.0 T+"  |
| ESC | J          | Num      | Projectname<br>string  | After the ' <u>#SJ</u> ' command, the macro-projectname is transmitted. e.g. "init / delivery state"  |
| ESC | I          | 21       | X-dots, Y-dots,<br>Version,<br>Touchinfo,<br>CRC-ROM,<br>CRC-ROMsoll<br>DF in KB,<br>CRC-DF, CRC-<br>DFsoll, DFlen | After the '#SI' command, internal information is sent by PLUG (16-Bit integer values LO-HI Byte)<br><b>Version</b> : LO-Byte = version number Software; HI-Byte = Hardware revison letter touch<br><b>Touchinfo</b> : LO-Byte = '- +' X direction detected; HI-Byte = '- +' Y direction detected<br><b>DFIen</b> : number of user bytes in data flash memory (3 Bytes: LO-, MID- HI-Byte) |

**EA PLUG-Series** 

| ESC | 1.1/ | Num | Channel, Format | After the <u>#VS</u> command, the formated string of the analog <b>Channel</b> (ADC: 12/ |
|-----|------|-----|-----------------|--|
| E30 | vv   | Num | string          | DAC: 128) is transmitted   |

# Response without length specification

| ESC | U | L | x, y, Image<br>data | after the ' <u>#UH</u> ' command, a hard copy is sent in BLH Format. <b>x</b> , <b>y</b> = Start<br>coordinates of the hard copy (upper<br>corner)<br>BLH-Data: 2 Byte: Width, height (in Pixel)+ amount of bytes of image data<br>amount = ((width+7)/8*height |
|-----|---|---|---------------------|---|

## **KITEDITOR**

The EA KIT Editor combines 3 functions:

- The editor itself which allows a simple definition of the macros, pictures and fonts like a standard text editor.
- The compiler which translates the text into the uploading code and shows up syntax error.
- The transmitter which search the right connection and uploads the data into the EA PLUG-Series.

The KitEditor is part of the EA LCD-Tools. These also include the necessary compiler and other tools like BitmapEdit or LCDterminal. You can download LCD-Tools from our website.

# ELECTRICAL CHARACTERISTICS (T<sub>A</sub>=20°C; V<sub>in</sub>=3,3V)
